

## Assignment:

As part of the evaluation process, you are required to complete a React-based assignment.

You need to build a simple Book Management System that allows users to view, add, update, and delete books. The application should integrate with an API (you may use a mock API such as JSON Server, MockAPI, or any hosted alternative) to perform all CRUD operations.

The application should display a list of books with details such as title, author, genre, and publication year. Users should be able to add new books through a form, edit existing entries, and delete books. Additionally, implement a search functionality to filter books by title or author, along with basic filtering (for example, by genre).

Focus on writing clean, maintainable code with proper component structure. Handling API calls, loading states, and basic error scenarios is expected. You may use any styling approach of your choice.

Once completed, you are also required to deploy the application and share a live URL (for example, using Vercel, Netlify, or similar platforms). Ensure the deployed application is fully functional, including API integration.

Please share:

- GitHub repository link
- Live deployed URL
- README with setup instructions
